

Advanced Control Systems Start Here

Your business has sophisticated control system needs. Whether you're responsible for a wastewater treatment plant, the smelting operation at a foundry, or the precise material handling needs of a manufacturing facility, you want the best available technology for your situation.

Revere Control Systems specializes in automation and communication solutions for municipal and industrial applications. Since 1980, we've been designing and producing control systems utilizing the latest in hardware and software technologies. We have the expertise to develop a solution for your needs, however sophisticated or however basic they may be.

A Great Deal More Than Superior Craftmanship

Superior craftsmanship is only one facet of what Revere offers you. Superior knowledge and experience are others. We understand your

application. Whether it's municipal or industrial in nature, we have people who speak your language and understand your needs. Engineers who are up to speed on the latest control system hardware and software. Engineers who can design the most value into your system. Engineers who can deliver to you the most advanced control system that your money can buy.

And our services don't stop with engineering and production. We can provide whatever degree of help you need. From conceptual design and cost estimating to startup and training, we do everything we can to make sure that your system performs as you need it to, in the time frame that meets your schedule. In essence, we do what we say we're going to do; we stand by our word; and we treat your business with the respect you deserve. Engineered to Serve describes more than our products; it also describes our company.

Specialists in Full Service Systems Integration

As our company has grown, our personnel team has acquired specialists in many areas. These include both vertical markets and horizontal applications. The result is that we can bring to bear on any project a team of specialists who are matched to the needs of our customers.

Water cooled capacitors, buss, thyristors, and inductor highlight the power controls system for a 600-kW, 100-Hz aluminum induction melt furnace at a large foundry in Quebec. Such projects involve a team of specialists utilizing many skills to achieve a solution.

Customized Software Development

We specialize in customized software programming needed for so many in-plant systems, whether they be PLC, PC, or DCS platforms. Relay systems, too. Our engineers are experienced in all major operator-machine interface software applications. Getting your computers to communicate is also no problem because our engineers are experienced with all major network protocols. We work with you to determine the specific needs of your project to assure that the interface and the network are tailored to provide optimum performance and user-friendliness. We believe in custom fit instead of one-size-fits-all. We give you what you need. The way you need it.

This operator's console chair provides complete chip mill controls at an Alabama wood yard using multiple PLCs on a data highway. Revere handled the project on a turnkey basis from conceptual design through startup and training.

Whether the project involves power distribution, radio telemetry, programmable logic controllers, or SCADA; whether it is in a mining application, or metals, or forest products, or municipal systems, or utilities, or oil & gas; whether it is as simple as a lift station or as complex as an entire plant control system and the associated networking of all the related systems; we have the specialists on board to assure that your needs for full service systems integration are met.

The Revere Control Systems Added Value

Comprehensive System Documentation

Since our systems are designed for dependable, long-term service, we do everything we can to assure that you will be able to maintain that performance. That's why a comprehensive documentation package is provided with every system. We understand the importance of documentation in starting, troubleshooting and maintaining a system, so we include all pertinent drawings, program listings, software diskettes, and instruction manuals for operation and maintenance. For what we produce and for equipment from vendors.

Tech Support and Field Service

Whatever level of support you need, we're there to help. From installation management to startup to operator training. And long after the project's up and running, we'll be there if you need us to provide telephone help, on-site service work, or field retrofits. Responsiveness and value are hallmarks of our support group.

Classroom and On-Site Training

Training is critical to successful operation and service of your system. We understand that. Our dedicated, in-house classroom facility allows us to train your people to operate and maintain your system. We can even combine the training with the testing process so that students will train on your specific system, further enhancing the training's effectiveness. Or if need be, we can bring our expertise to your location and perform training in your facility.

When you call Revere, we listen. We work closely with you so we can analyze the full spectrum of your control system needs. Then we design, build, document and support the highest quality controls for:

- Water and Wastewater
- Foundry and Metals
- Mining
- Oil and Gas
- Pulp and Paper
- Forest and Wood Products
- Automotive
- Material Handling
- Food and Beverage
- Utilities and Power

Revere Control Systems

ONLY THE

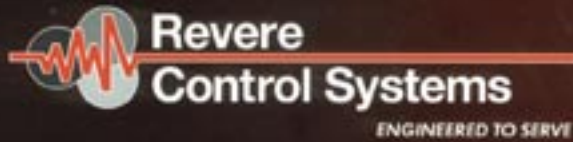

In our business, high standards are more than a luxury. They have to be the norm. You shouldn't expect anything less than the highest quality components and workmanship. And we won't deliver anything less.

But high standards apply to a lot more than what we produce. High standards are a way of doing business, woven throughout our conduct and all our business relationships. From the fair and ethical way we treat

vendors and customers to the way we stand by our commitments. From the way we strive to give you the maximum value possible to the way we resolve a problem. No shopping bids. No unauthorized substitutions or changes. No ducking responsibilities. We believe that integrity is the foundation of good business. And we won't do business without it.
